

## Install Weaved for ssh (22) and http (80) on the Netcomm Wireless NWL-25.

1. Retrieve the file "netcomm.tgz" onto the NWL-25 modem from the Internet repository at "https://github.com/weaved/installer/raw/master/Netcomm/netcomm.tgz"
2. Untar the file on the modem with command "tar xzvf netcomm.tgz"
3. Run the installer from the modem cmd line "./install" This will enable ports http 80 and ssh 22 on the modem for remote access using Weaved.
4. Reboot the modem and connect a PC to the NWL-25 modem, using the modem as the PC's broadband connection to the Internet.
5. Open a browser on PC and goto [www.weaved.com](http://www.weaved.com) to Sign In (upper right). If you don't already have a Weaved account then use the link "Sign Up" to create one.
6. Follow instructions on the Service List page to register the ssh and http services on the Device List page after login at [weaved.com](http://weaved.com)

(**NOTE:** you must use a browser running behind the same public IP Address as the modem itself. This is so [weaved.com](http://weaved.com) can auto-detect the unregistered ssh & http services on the modem coming from the same public IP address as the browser. Any browser on a machine connected to the Internet through the modem will work fine.)

You should see the "waiting registration" messages in the browser screen as follows:

We found an unregistered **HTTP** service on the **Edison** device on your network at **10.32.61.76**. Use [Register Now](#) to complete registration to your Weaved account.

We found an unregistered **SSH** service on the **Edison** device on your network at **10.32.61.76**. Use [Register Now](#) to complete registration to your Weaved account.

Now you can register the services to your account. Click Register Now.

Note the message in the green box may read slightly differently than the one shown above.
